

NetKem

Product description

Netrex AF

Antifouling for fishing nets

Description

Netrex AF is a highly effective antifouling for fishing nets which reduces growth, eases cleaning and prevents drying out.

Netrex AF was introduced in 1985 as the first waterbased antifouling. Since then the environment has been spared for millions of litres of solvents. Netrex AF is marketed in numerous countries and is still one of the leading antifouling products for fishing nets.

Benefits

- Easy to apply.
- Permits drying of nets hanging in a tangle.
- Nets can be stored after treatment.
- Nets stay soft and elastic because Netrex AF penetrates into knots and strands.
- Easy cleaning as growth (sea weed and alga) falls off easily when rinsing.
- Treatment can be carried out indoors without any special precautions or requirements to ventilation.

Properties

The cuprous oxide is dustfree and therefore has no adverse environmental effects.

Water is used as a dilutant (emulsion). The treatment can be carried out even on moist nets.

Application

Stir vigorously. To be used undiluted on clean nets. Allow the nets to soak in Netrex AF for minimum 15 minutes, and then let them dry well. Drying time is approx. 8 hours depending on drying conditions.

Important:

If the nets have not been treated before, it is recommended to make a test treatment in order to ensure a satisfactory result. The drying of a small test part may be accelerated with the aid of a hair dryer. (Do not exceed 40 °C.) A test is always recommended when treating unknown nets.

Nets must be completely dry before they are reused.

Treated nets should only be used in open waters.

Not recommended for use in ponds or tanks where copper from treated nets may accumulate.

Do not expose to temperatures below +4 °C.

Typical product data

Colour, dry film	Appearance	pH-value	Flashpoint
Red	Red emulsion	7 (neutral)	As delivered: None Dry film: Above 200 °C
